

AN ARTIFICIAL WALL

ABSTRACT OF THE DISCLOSURE

A decorative liner configured to secure to an underlying structure to beautify the underlying structure. A mold is coated with a urethane release formula. Design colors are sprayed onto a pattern of the mold to reflect a natural rock appearance. Polyurethane is sprayed over the colors and onto the mold according to well known molding techniques. The liner is removed and touched up for imperfections and coated with an ultraviolet coating to protect against fading. The underlying structure is measured and the liner is cut to match the underlying structure dimensions. Screws fasten the liner to the underlying structure. The screw heads are painted to match the appearance of the liner. Where first and second liners meet, particularly at a corner, the first liner is trimmed to match the outline of the second liner. The liners are glued together where the first and second liners meet. The first liner is painted to match rock protrusions where the first and second liners meet.
